# Chapter 1

## Introduction

Over the last few decades, researchers have expended significant effort on developing efficient iterative methods for solving discretized partial differential equations (PDEs). Though these efforts have yielded many mathematically optimal solvers such as the multigrid method, the unfortunate reality is that multigrid methods have not been much used in practical applications. This marked gap between theory and practice is mainly due to the fragility of traditional multigrid (MG) methodology and the complexity of its implementation. We aim to develop techniques and the corresponding software that will narrow this gap, specifically by developing mathematically optimal solvers that are robust and easy to use in practice.

We believe that there is no one-size-for-all solution method for discrete linear systems from different applications. And, efficient iterative solvers can be constructed by taking the properties of PDEs and discretizations into account. In this project, we plan to construct a pool of discrete problems arising from partial differential equations (PDEs) or PDE systems and efficient linear solvers for these problems. We mainly utilize the methodology of Auxiliary Space Preconditioning (ASP) to construct efficient linear solvers. Due to this reason, this software package is called Fast Auxiliary Space Preconditioning or FASP for short.

FASP contains the kernel part and several applications (ranging from fluid dynamics to reservoir simulation). The kernel part is open-source and licensed under GNU Lesser General Public License or LGPL version 3.0 or later. Some of the applications contain contributions from and owned partially by other parties.

For the moment, FASP is under alpha testing. If you wish to obtain a current version of FASP or you have any questions, feel free to contact us at [faspdev@gmail.com](mailto:faspdev@gmail.com).

This software is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

# How to obtain FASP

For the moment, FASP is still under alpha testing. You need a password to download the package. Sorry about it!

The most updated version of FASP can be downloaded from

<http://fasp.sourceforge.net/download/faspsolver.zip>

We use HG (Mecurial) as our main version control tool. HG is easy to use and it is available at all OS platforms. For people who is interested in the developer version, you can obtain the FASP package with hg:

```
$ hg clone https://faspusers@bitbucket.org/fasp/faspsolver
```

will give you the developer version of the FASP package.

## Chapter 3

# Building and Installation

This is a simple instruction on building and testing. For more details, please refer to the README files and the short [User's Guide](#) in "faspolver/doc/".

To compile, you need a Fortran and a C compiler. First, you can type in the "faspolver/" root directory:

```
$ make config
```

which will config the environment automatically. And, then, you can need to type:

```
$ make install
```

which will make the FASP shared static library and install to PREFIX/. By default, FASP libraries and executables will be installed in the FASP home directory "faspolver/".

There is a simple GUI tool for building and installing FASP included in the package. You need Tcl/Tk support in your computer. You may call this GUI by run in the root directory:

```
$ wish fasp_install.tcl
```

If you need to see the detailed usage of "make" or need any help, please type:

```
$ make help
```

After installation, tutorial examples can be found in "tutorial/".

# Doxygen

We use Doxygen as our automatically documentation generator which will make our future maintainance minimized. You can obtain the software (Windows, Linux and OS X) as well as its manual on the official website

<http://www.doxygen.org>

For an ordinary user, Doxygen is completely trivial to use. We only need to use some special marker in the usual comment as we put in c-files.

### 8.10.2 Field Documentation

#### 8.10.2.1 INT\* JA

Element  $i$  of the integer array columns is the number of the column in the block matrix that contains the  $i$ -th non-zero block. The size is NNZ.

Definition at line 67 of file fasp\_block.h.

#### 8.10.2.2 REAL\* val

A real array that contains the elements of the non-zero blocks of a sparse matrix. The elements are stored block-by-block in row major order. A non-zero block is the block that contains at least one non-zero element. All elements of non-zero blocks are stored, even if some of them is equal to zero. Within each nonzero block elements are stored in row-major order and the size is  $(NNZ*nb*nb)$ .

9.11.2.1 `void fasp_blas_array_ax ( const INT n, const REAL a, REAL * x )`

$x = a * x$

Parameters

<i>n</i>	Number of variables
<i>a</i>	Factor a
<i>x</i>	Pointer to x

Author

Chensong Zhang

Date

07/01/209

Modified by Chunsheng Feng, Xiaoqiang Yue on 05/23/2012

Note

*x* is reused to store the resulting array.

Definition at line 35 of file blas\_array.c.

9.11.2.2 `void fasp_blas_array_axpy ( const INT n, const REAL a, REAL * x, const REAL b, REAL * y )`

$y = a * x + b * y$

Parameters

<i>n</i>	Number of variables
<i>a</i>	Factor a
<i>x</i>	Pointer to x
<i>b</i>	Factor b
<i>y</i>	Pointer to y

### 9.14.1 Detailed Description

BLAS operations for `dCSRmat` matrices.

#### Note

Sparse functions usually contain three runs. The three runs are all the same but they serve different purpose.

Example: If you do  $c=a+b$ :

- first do a dry run to find the number of non-zeroes in the result and form `ic`;
- allocate space (memory) for `jc` and form this one;
- if you only care about a "boolean" result of the addition, you stop here;
- you call another routine, which uses `ic` and `jc` to perform the addition.

Definition in file `blas_csr.c`.

### 9.14.2 Function Documentation

9.14.2.1 void `fasp_blas_dcsr_aAxy` ( `const REAL alpha`, `dCSRmat * A`, `REAL * x`, `REAL * y` )

Matrix-vector multiplication  $y = \alpha*A*x + y$ .

Driver to compute triple matrix product  $P^*A*P$  using Itz CSR format. In Itx format: ia[0]=1, ja[0] and a[0] are used as usual. When called from Fortran, ia[0], ja[0] and a[0] will be just ia(1),ja(1),a(1). For the indices, ia\_ltz[k] = ia\_usual[k]+1, ja\_ltz[k] = ja\_usual[k]+1, a\_ltz[k] = a\_usual[k].

#### 9.19.2.2 INT fasp\_check\_diagdom ( dCSRmat \* A )

Check whether a matrix is diagonal dominant.

INT fasp\_check\_diagdom ([dCSRmat](#) \*A)

##### Parameters

A	Pointer to the <a href="#">dCSRmat</a> matrix
---	---

##### Returns

Number of the rows which are diagonal dominant

##### Note

The routine checks whether the sparse matrix is diagonal dominant on every row. It will print out the percentage of the rows which are diagonal dominant and which are not; the routine will return the number of the rows which are diagonal dominant.

**9.19.2.4 SHORT fasp\_check\_diagzero ( dCSRmat \*  $A$  )**

Check whether a CSR sparse matrix has diagonal entries that are very close to zero.

## Parameters

$A$	pointer to the <a href="#">dCSRmat</a> matrix
-----	---

## Returns

FASP\_SUCCESS if no diagonal entry is close to zero, else ERROR (negative value)

## Author

Shuo Zhang

## Date

Definition at line 310 of file checkmat.c.

#### 9.19.2.6 INT fasp\_check\_symm ( dCSRmat \* A )

Check symmetry of a sparse matrix of CSR format.

## Parameters

<i>A</i>	Pointer to the <a href="#">dCSRmat</a> matrix
----------	---

## Returns

1 and 2 if the structure of the matrix is not symmetric; 0 if the structure of the matrix is symmetric,

## Note

Print the maximal relative difference between matrix and its transpose.

#### 9.22.2.2 REAL endian\_convert\_real ( const REAL *rnum*, INT *ilength*, INT *endianflag* )

Swap order of a REAL number.

##### Parameters

<i>rnum</i>	An REAL value
<i>ilength</i>	Length of INT: 2 for short, 4 for int, 8 for long
<i>endianflag</i>	If <i>endianflag</i> = 1, it returns <i>rnum</i> itself If <i>endianflag</i> = 2, it returns the swapped <i>rnum</i>

##### Returns

Value of *rnum* or swapped *rnum*

### 9.39.1 Detailed Description

Initialize important data structures.

#### Note

Every structures should be initialized before usage.

Definition in file [init.c](#).

### 9.39.2 Function Documentation

#### 9.39.2.1 `AMG_data_bsr * fasp_amg_data_bsr_create ( SHORT max_levels )`

Create and initialize [AMG\\_data](#) data sturcture for AMG/SAMG (BSR format)

#### Parameters

<i>max_levels</i>	Max number of levels allowed
-------------------	------------------------------

#### Returns

Pointer to the [AMG\\_data](#) data structure

Read A from a disk file in [dBSRmat](#) format.

## Parameters

<i>filename</i>	File name for matrix A
<i>A</i>	Pointer to the <a href="#">dBSRmat</a> A

## Note

This routine reads a [dBSRmat](#) matrix from a disk file in the following format:  
File format:

- ROW, COL, NNZ
- nb: size of each block
- storage\_manner: storage manner of each block
- ROW+1: length of IA
- IA(i), i=0:ROW
- NNZ: length of JA

9.47.2.4 void fasp\_dbsr\_write\_coo ( const char \* *filename*, const dBSRmat \* *A* )

Print out a dBSRmat matrix in coordinate format for matlab spy.

## Parameters

<i>filename</i>	Name of file to write to
<i>A</i>	Pointer to the <a href="#">dBSRmat</a> matrix A

#### 9.47.2.5 void fasp\_dcoo1\_read ( const char \* *filename*, dCOOmat \* *A* )

Read A from matrix disk file in IJ format – indices starting from 0.

## Parameters

<i>filename</i>	File name for matrix
<i>A</i>	Pointer to the COO matrix

## Note

File format:

- nrow ncol nnz % number of rows, number of columns, and nnz
- i j a\_ij % i, j a\_ij in each line

difference between fasp\_dcoo\_read and this function is this function do not change to CSR format

**9.47.2.7 void fasp\_dcoo\_read ( const char \* filename, dCSRmat \* A )**

Read A from matrix disk file in IJ format – indices starting from 0.

## Parameters

<i>filename</i>	File name for matrix
<i>A</i>	Pointer to the CSR matrix

## Note

File format:

- nrow ncol nnz % number of rows, number of columns, and nnz
- i j a\_ij % i, j a\_ij in each line

After reading, it converts the matrix to [dCSRmat](#) format.

**9.47.2.8 void fasp\_dcoo\_shift\_read ( const char \* filename, dCSRmat \* A )**

Read A from matrix disk file in IJ format – indices starting from 0.

## Parameters

<i>filename</i>	File name for matrix
<i>A</i>	Pointer to the CSR matrix

## Note

File format:

- nrow ncol nnz % number of rows, number of columns, and nnz
- i j a\_ij % i, j a\_ij in each line

i and j suppose to start with index 1!!!

After read in, it shifts the index to C fashin and converts the matrix to [dCSRmat](#) format.

9.47.2.9 void fasp\_dcoo\_write ( const char \* *filename*, dCSRmat \* *A* )

Write a matrix to disk file in IJ format (coordinate format)

## Parameters

<i>A</i>	pointer to the <a href="#">dCSRmat</a> matrix
<i>filename</i>	char for vector file name

## Note

The routine writes the specified REAL vector in COO format.  
Refer to the reading subroutine \ref fasp\_dcoo\_read.

## File format:

- The first line of the file gives the number of rows, the number of columns, and the number of nonzeros.
- Then gives nonzero values in i j a(i,j) format.

9.47.2.13 void fasp\_dcsrvec1\_read ( const char \* *filename*, dCSRmat \* *A*, dvector \* *b* )

Read A and b from a SINGLE disk file.

## Parameters

<i>filename</i>	File name
<i>A</i>	Pointer to the CSR matrix
<i>b</i>	Pointer to the dvector

## Note

This routine reads a dCSRmat matrix and a dvector vector from a single disk file.

The difference between this and fasp\_dcoovec\_read is that this routine support non-square matrices.

File format:

- nrow ncol % number of rows and number of columns
- ia(j), j=0:nrow % row index

- $ja(j)$ ,  $j=0:nnz-1$  % column index

## Parameters

<i>filemat</i>	File name for matrix
<i>filerhs</i>	File name for right-hand side
<i>A</i>	Pointer to the dCSR matrix
<i>b</i>	Pointer to the dvector

## Note

This routine reads a dCSRmat matrix and a dvector vector from a disk file.

CSR matrix file format:

- nrow % number of columns (rows)
- ia(j), j=0:nrow % row index
- ja(j), j=0:nnz-1 % column index

**9.48.2.1** `INT fasp_solver_bdcsl_itsolver ( block_dCSRmat * A, dvector * b, dvector * x, precondition * pc, itsolver_param * itparam )`

Solve  $Ax = b$  by standard Krylov methods.

Parameters

<i>A</i>	Pointer to the coeff matrix in <code>block_dCSRmat</code> format
<i>b</i>	Pointer to the right hand side in dvector format
<i>x</i>	Pointer to the approx solution in dvector format
<i>pc</i>	Pointer to the preconditioning action
<i>itparam</i>	Pointer to parameters for iterative solvers

### 9.49.1 Detailed Description

Iterative solvers for `dBSRmat` matrices.

Definition in file `itsolver_bsr.c`.

### 9.49.2 Function Documentation

#### 9.49.2.1 void fasp\_set\_GS\_threads ( INT threads, INT its )

Set threads for CPR. Please add it at the begin of Krylov openmp method function and after iter++.

Parameters

<i>threads</i>	Total threads of solver
<i>its</i>	Current its of the Krylov methods

#### 9.49.2.2 INT fasp\_solver\_dbsr\_itsolver ( dBSRmat \* A, dvector \* b, dvector \* x, precondition \* pc, itsolver\_param \* itparam )

Solve  $Ax=b$  by preconditioned Krylov methods for BSR matrices.

## Parameters

<i>A</i>	Pointer to the coeff matrix in <a href="#">dBSRmat</a> format
<i>b</i>	Pointer to the right hand side in dvector format
<i>x</i>	Pointer to the approx solution in dvector format
<i>pc</i>	Pointer to the preconditioning action
<i>itparam</i>	Pointer to parameters for iterative solvers

#### Parameters

<i>A</i>	Pointer to the coeff matrix in dSTRmat format
<i>b</i>	Pointer to the right hand side in dvector format
<i>x</i>	Pointer to the approx solution in dvector format
<i>itparam</i>	Pointer to parameters for iterative solvers
<i>iluparam</i>	Pointer to parameters for ILU

#### Returns

Number of iterations if succeed

### 9.55.2 Function Documentation

#### 9.55.2.1 SHORT fasp\_smat\_lu\_decomp ( [REAL](#) \* A, [INT](#) pivot[], [INT](#) n )

LU decomposition of A usind Doolittle's method.

##### Parameters

<i>A</i>	Pointer to the full matrix
<i>pivot</i>	Pivoting positions
<i>n</i>	Size of matrix A

##### Returns

FASP\_SUCCESS if succeed, ERROR\_UNKNOWN if fail

##### Note

Use Doolittle's method to decompose the  $n \times n$  matrix A into a unit lower triangular matrix L and an upper triangular matrix U such that  $A = LU$ . The matrices L and U replace the matrix A. The diagonal elements of L are 1 and are not stored.

The Doolittle method with partial pivoting is: Determine the pivot row and interchange the current row with the pivot row, then assuming that row k is the current row,  $k = 0, \dots, n-1$  evaluate in order the following pair of expressions  $U[k][j] = A[k][j] - (L[k][0]*U[0][j] + \dots + L[k][k-1]*U[k-1][j])$  for  $j = k, k+1, \dots, n-1$   $L[i][k] = (A[i][k] - (L[i][0]*U[0][k] + \dots + L[i][k-1]*U[k-1][k])) / U[k][k]$  for  $i = k+1, \dots, n-1$ .

**9.55.2.2 SHORT fasp\_smat\_lu\_solve ( REAL \* A, REAL b[], INT pivot[], REAL x[], INT n )**Solving  $Ax=b$  using LU decomposition.**Parameters**

<i>A</i>	Pointer to the full matrix
<i>b</i>	Right hand side array
<i>pivot</i>	Pivoting positions
<i>x</i>	Pointer to the solution array
<i>n</i>	Size of matrix A

**Returns**

FASP\_SUCCESS if succeed, ERROR\_UNKNOWN if failed

**Note**

This routine uses Doolittle's method to solve the linear equation  $Ax = b$ . This routine is called after the matrix A has been decomposed into a product of a unit lower triangular matrix L and an upper triangular matrix U with pivoting. The solution proceeds by solving the linear equation  $Ly = b$  for y and subsequently solving the linear equation  $Ux = y$  for x.

Definition in file [ordering.c](#).

### 9.62.2 Function Documentation

#### 9.62.2.1 void fasp\_aux\_dQuickSort ( [REAL](#) \* a, [INT](#) left, [INT](#) right )

Sort the array (REAL type) ascendingly with the quick sorting algorithm.

## Parameters

<i>a</i>	Pointer to the array needed to be sorted
<i>left</i>	Starting index
<i>right</i>	Ending index

## Author

Zhiyang Zhou

## Date

2009/11/28

## Note

'left' and 'right' are usually set to be 0 and n-1, respectively where n is the length of 'a'.

Definition at line 238 of file ordering.c.

**9.62.2.2** void fasp\_aux\_dQuickSortIndex ( REAL \* *a*, INT *left*, INT *right*, INT \* *index* )

Reorder the index of (REAL type) so that 'a' is ascending in such order.

## Parameters

<i>a</i>	Pointer to the array
<i>left</i>	Starting index
<i>right</i>	Ending index
<i>index</i>	Index of 'a' (out)

## Author

Zhiyang Zhou

## Date

2009/12/02

## Note

'left' and 'right' are usually set to be 0 and n-1, respectively, where n is the length of 'a'. 'index' should be initialized in the nature order and it has the same length as 'a'.

Definition at line 319 of file ordering.c.

**9.62.2.3** void fasp\_aux\_iQuickSort ( INT \* *a*, INT *left*, INT *right* )

Sort the array (INT type) ascendingly with the quick sorting algorithm.

## Parameters

<i>a</i>	Pointer to the array needed to be sorted
<i>left</i>	Starting index
<i>right</i>	Ending index

## Author

Zhiyang Zhou

## Date

11/28/2009

## Note

Definition at line 200 of file ordering.c.

**9.62.2.4** void fasp\_aux\_iQuickSortIndex ( INT \* *a*, INT *left*, INT *right*, INT \* *index* )

Reorder the index of (INT type) so that 'a' is in ascending order.

## Parameters

<i>a</i>	Pointer to the array
<i>left</i>	Starting index
<i>right</i>	Ending index
<i>index</i>	Index of 'a' (out)

## Author

Zhiyang Zhou

## Date

2009/12/02

Definition at line 278 of file ordering.c.

**9.62.2.5** void fasp\_aux\_merge ( INT *numbers*[], INT *work*[], INT *left*, INT *mid*, INT *right* )

Merge two sorted arrays.

## Parameters

<i>numbers</i>	Pointer to the array needed to be sorted
<i>work</i>	Pointer to the work array with same size as numbers
<i>left</i>	Starting index of array 1
<i>mid</i>	Starting index of array 2
<i>right</i>	Ending index of array 1 and 2

## Author

Chensong Zhang

## Date

11/21/2010

## Note

Both arraies are stored in numbers! Arraies should be pre-sorted!

Definition at line 107 of file ordering.c.

9.62.2.6 void fasp\_aux\_msort ( INT *numbers*[], INT *work*[], INT *left*, INT *right* )

Sort the INT array ascendingly with the merge sort algorithm.

## Parameters

<i>numbers</i>	Pointer to the array needed to be sorted
<i>work</i>	Pointer to the work array with same size as numbers
<i>left</i>	Starting index
<i>right</i>	Ending index

## Author

Chensong Zhang

## Date

Definition at line 169 of file ordering.c.

9.62.2.7 INT fasp\_aux\_unique ( INT *numbers*[], INT *size* )

Remove duplicates in an sorted (ascending order) array.

**Parameters**

<i>numbers</i>	Pointer to the array needed to be sorted (in/out)
<i>size</i>	Length of the target array

**Returns**

New size after removing duplicates

**Author**

Chensong Zhang

**Date**

11/21/2010

**Note**

Operation is in place. Does not use any extra or temporary storage.

Definition at line 74 of file ordering.c.

**9.62.2.8 INT fasp\_BinarySearch ( INT \* *list*, INT *value*, INT *list\_length* )**

Binary Search.

**Parameters**

<i>list</i>	Pointer to a set of values
<i>value</i>	The target
<i>list_length</i>	Length of the array list

**Returns**

The location of value in array list if succeeded, otherwise, return -1.

**Author**

Chunsheng Feng

#### 9.65.1 Detailed Description

Krylov subspace methods – Preconditioned BiCGstab (matrix free)

Abstract algorithm of Krylov method

Krylov method to solve  $A*x=b$  is to generate  $\{x_k\}$  to approximate  $x$ , where  $x_k$  is the optimal solution in Krylov space

$V_k = \text{span}\{r_0, A*r_0, A^2*r_0, \dots, A^{k-1}*r_0\}$ ,

under some inner product.

For the implementation, we generate a series of  $\{p_k\}$  such that  $V_k = \text{span}\{p_1, \dots, p_k\}$ . Details:

Step 0. Given  $A, b, x_0, M$

Step 1. Compute residual  $r_0 = b - A \cdot x_0$  and convergence check;

Step 2. Initialization  $z_0 = M^{-1} \cdot r_0, p_0 = z_0$ ;

Step 3. Main loop ...

FOR  $k = 0 : \text{MaxIt}$

- get step size  $\alpha = f(r_k, z_k, p_k)$ ;
- update solution:  $x_{k+1} = x_k + \alpha \cdot p_k$ ;
- perform stagnation check;
- update residual:  $r_{k+1} = r_k - \alpha \cdot (A \cdot p_k)$ ;
- perform residual check;
- obtain  $p_{k+1}$  using  $\{p_0, p_1, \dots, p_k\}$ ;
- prepare for next iteration;
- print the result of  $k$ -th iteration; END FOR

Convergence check is:  $\text{norm}(r)/\text{norm}(b) < \text{tol}$

Stagnation check is like following:

- IF  $\text{norm}(\alpha \cdot p_k)/\text{norm}(x_{k+1}) < \text{tol\_stag}$ 
  1. compute  $r = b - A \cdot x_{k+1}$ ;
  2. convergence check;
  3. IF ( not converged & restart\_number < Max\_Stag\_Check ) restart;
- END IF

Residual check is like following:

- IF  $\text{norm}(r_{k+1})/\text{norm}(b) < \text{tol}$ 
  1. compute the real residual  $r = b - A \cdot x_{k+1}$ ;
  2. convergence check;
  3. IF ( not converged & restart\_number < Max\_Res\_Check ) restart;
- END IF

#### 9.67.1 Detailed Description

Krylov subspace methods – Preconditioned conjugate gradient (matrix free)

Abstract algorithm

PCG method to solve  $A*x=b$  is to generate  $\{x_k\}$  to approximate  $x$

Step 0. Given  $A$ ,  $b$ ,  $x_0$ ,  $M$

Step 1. Compute residual  $r_0 = b - A*x_0$  and convergence check;

Step 2. Initialization  $z_0 = M^{-1}*r_0$ ,  $p_0=z_0$ ;

Step 3. Main loop ...

FOR k = 0:MaxIt

- get step size  $\alpha = f(r_k, z_k, p_k)$ ;
- update solution:  $x_{k+1} = x_k + \alpha * p_k$ ;
- perform stagnation check;
- update residual:  $r_{k+1} = r_k - \alpha * (A * p_k)$ ;
- perform residual check;
- obtain  $p_{k+1}$  using  $\{p_0, p_1, \dots, p_k\}$ ;
- prepare for next iteration;
- print the result of k-th iteration; END FOR

Convergence check is:  $\text{norm}(r)/\text{norm}(b) < \text{tol}$

Stagnation check is like following:

- IF  $\text{norm}(\alpha * p_k)/\text{norm}(x_{k+1}) < \text{tol\_stag}$ 
  1. compute  $r = b - A * x_{k+1}$ ;
  2. convergence check;
  3. IF ( not converged & restart\_number < Max\_Stag\_Check ) restart;
- END IF

Residual check is like following:

- IF  $\text{norm}(r_{k+1})/\text{norm}(b) < \text{tol}$ 
  1. compute the real residual  $r = b - A * x_{k+1}$ ;
  2. convergence check;
  3. IF ( not converged & restart\_number < Max\_Res\_Check ) restart;
- END IF

#### 9.87.2.1 void `fasp_smoother_dbsr_gs` ( `dBSRmat * A`, `dvector * b`, `dvector * u`, `INT order`, `INT * mark` )

Gauss-Seidel relaxation.

Parameters

<i>A</i>	Pointer to <code>dBSRmat</code> : the coefficient matrix
<i>b</i>	Pointer to <code>dvector</code> : the right hand side

<i>u</i>	Pointer to dvector: the unknowns (IN: initial, OUT: approximation)
<i>order</i>	Flag to indicate the order for smoothing If mark = NULL ASCEND 12: in ascending order DESCEND 21: in descending order If mark != NULL: in the user-defined order

9.98.2.1 void `fasp_sparse_aat_` ( INT \* ia, INT \* ja, REAL \* a, INT \* na, INT \* ma, INT \* iat, INT \* jat, REAL \* at )

transpose a boolean matrix (only given by ia, ja)

#### Parameters

<i>ia</i>	array of row pointers (as usual in CSR)
<i>ja</i>	array of column indices
<i>a</i>	array of entries of the input
<i>na</i>	number of rows of A
<i>ma</i>	number of cols of A
<i>iat</i>	array of row pointers in the result
<i>jat</i>	array of column indices
<i>at</i>	array of entries of the result

Definition at line 272 of file `sparse_util.c`.

Multiplication of two sparse matrices: calculating the numerical values in the result.

## Parameters

<i>ia</i>	array of row pointers 1st multiplicand
<i>ja</i>	array of column indices 1st multiplicand
<i>a</i>	entries of the 1st multiplicand
<i>ib</i>	array of row pointers 2nd multiplicand
<i>jb</i>	array of column indices 2nd multiplicand
<i>b</i>	entries of the 2nd multiplicand
<i>ic</i>	array of row pointers in $c=a*b$
<i>jc</i>	array of column indices in $c=a*b$
<i>c</i>	entries of the result: $c= a*b$
<i>nap</i>	number of rows in the 1st multiplicand

Definition at line 431 of file `sparse_util.c`.

**9.98.2.6** `void fasp_sparse_iit_ ( INT * ia, INT * ja, INT * na, INT * ma, INT * iat, INT * jat )`

Transpose a boolean matrix (only given by *ia*, *ja*)

Parameters

<i>ia</i>	array of row pointers (as usual in CSR)
<i>ja</i>	array of column indices
<i>na</i>	number of rows
<i>ma</i>	number of cols
<i>iat</i>	array of row pointers in the result
<i>jat</i>	array of column indices

Note

For the concrete algorithm, see:

Definition at line 197 of file `sparse_util.c`.

**9.98.2.7** `ivector fasp_sparse_MIS ( dCSRmat * A )`

get the maximal independet set of a CSR matrix

## Parameters

<i>A</i>	pointer to the matrix
----------	-----------------------

## Note

: only use the sparsity of *A*, index starts from 1 (fortran)!!

information of *A*

work space

return

Calculates  $R \cdot A \cdot P$  after the nonzero structure of the result is known. *iac,jac,ac* have to be allocated before call to this function.

## Note

:I: is input :O: is output :IO: is both

## Parameters

<i>ir</i>	:I: array of row pointers for R
<i>jr</i>	:I: array of column indices for R
<i>r</i>	:I: entries of R
<i>ia</i>	:I: array of row pointers for A
<i>ja</i>	:I: array of column indices for A

### 9.102.1 Detailed Description

Krylov subspace methods – Preconditioned minimal residual with safe net.

Abstract algorithm

Krylov method to solve  $A*x=b$  is to generate  $\{x_k\}$  to approximate  $x$ , where  $x_k$  is the optimal solution in Krylov space

$V_k = \text{span}\{r_0, A*r_0, A^2*r_0, \dots, A^{k-1}*r_0\}$ ,

under some inner product.

For the implementation, we generate a series of  $\{p_k\}$  such that  $V_k = \text{span}\{p_1, \dots, p_k\}$ . Details:

Step 0. Given  $A$ ,  $b$ ,  $x_0$ ,  $M$

Step 1. Compute residual  $r_0 = b - A*x_0$  and convergence check;

Step 2. Initialization  $z_0 = M^{-1}*r_0$ ,  $p_0 = z_0$ ;
