Chapter 1

Introduction

1.1 General description

The Fast Auxiliary Space Preconditioning (FASP) package provides C source files¹ to build a library of iterative solvers and preconditioners for the solution of large-scale linear systems of equations. The components of the FASP basic library include several ready-to-use, modern, and efficient iterative solvers used in applications ranging from simple examples of discretized scalar partial differential equations (PDEs) to numerical simulations of complex, multicomponent physical systems via the Auxiliary Space Preconditioning framework [19].

The main components of the FASP basic library include:

- Basic linear iterative methods;
- Standard Krylov subspace methods;
- Geometric and Algebraic Multigrid (G/AMG) methods;
- Incomplete factorization methods.

Source files in the package are organized in various abstract levels as follows:

- Level 0 (Aux*.c): Auxiliary functions (timing, memory, threading, ...)
- Level 1 (Bla*.c): Basic linear algebra subroutines (SpMV, RAP, ILU, SWZ, ...)
- Level 2 (Itr*.c): Iterative methods and smoothers (Jacobi, GS, SOR, Poly, ...)
- Level 3 (Kry*.c): Krylov iterative methods (CG, BiCGstab, MinRes, GMRES, ...)
- Level 4 (Pre*.c): Preconditioners (GMG, AMG, FAMG, ...)
- Level 5 (Sol*.c): User interface for FASP solvers (Solvers, wrappers, ...)
- Level x (Xtr*.c): Interface to external packages (Mumps, Umfpack, ...)

¹The code is in the C99 (ISO/IEC 9899:1999) compatible.

The FASP distribution also includes several examples for solving simple benchmark problems. The basic (kernel) FASP distribution is open-source and is licensed under GNU Lesser General Public License or LGPL. Other distributions may have different licensing (contact the developer team for details on this).

LICENSING: This software is free software distributed under the Lesser General Public License or LGPL, version 3.0 or any later versions. This software distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License <http://www.gnu.org/licenses/> for more details.

1.2 Roadmap: from basics to complex applications

A distinct feature of the FASP software project is that it is an open ended project. It contains a basic kernel of sources and is maintained by a team of developers with the expertise to build efficient solvers for a wide range of complex numerical models.

As typical for an open-source software, the further development of FASP project will also be based on the involvement of the community. While we have our own plans for expanding FASP's capabilities, we also count on the users' input in providing requests for, as well as, contributions to, the expansion of FASP in different application areas. Our team is ready to provide (or help with) the design and the implementation of efficient solvers based on the FASP kernel to best meet the goals and the requirements of our users.

The FASP software has been successfully used to build efficient solvers for several discretized PDEs and systems of PDEs: general scalar elliptic equations; linear elasticity; Brinkman equation; bi-harmonic equation; Stokes and Navier-Stokes equations; $H(\text{curl})/H(\text{div})$ systems; Maxwell's system. The resulting solvers have been applied in simulations from fluid dynamics, underground water simulation, fluid-structure interactions, Oldroyd-B and Johnson-Segalman models, black-oil model, and magnetohydrodynamics (MHD).

Several of these benchmark problems are included as examples in the open-source distribution, others are under development or have more restrictive licensing.

1.3 How to use this guide

This user's guide describes how to use the existing solvers in FASP via a couple of simple tutorial problems. The user's guide is a self-contained document but does *not* provide any details about the algorithms or their implementation. Along with this guide, we provide a reference manual² for

²Available online at <http://www.multigrid.org/fasp>. It is also available in "fasp solver/doc/doc.zip".

technical details on the implementation which includes references. We recommend that the users read these references to better understanding of the code. Furthermore, since FASP is under heavy development, please use this guide with caution because the code might have been changed before this document is updated.

1.4 How to obtain FASP

There are several ways to download the FASP source files. We recommend users download the most updated version from the FASP page on SourceForge.

Downloading from SourceForge

The most updated version of FASP can be downloaded directly from

<http://www.multigrid.org/fasp/download/faspsolver.zip>

Downloading from BitBucket

FASP is also hosted on *BitBucket.org*³ using Mercurial (Hg)⁴. A Hg client for GNU Linux, Mac OS X, or Windows can be downloaded from

<http://mercurial.selenic.com/downloads/>

There are also many other third-party clients which provides Hg services, for example: EasyMercurial⁵ (cross platform) and SourceTree⁶ (for Mac OS X only).

As a DVCS (Distributed Version Control System) source-control software, Hg is relatively new. But compared with other tools like Git, Hg is considered *friendlier* with a lower learning curve. This is despite the fact that Hg uses two distinct sets of commands and two distinct vocabularies for operations depending upon whether the repository is local or remote. Documentation for Hg is substantially better, including a book⁷. They've also had the advantage of trying the documentation on a fairly savvy group of developers (Mozilla) who gave them lots of feedback that helped polish the rough edges.

Linux or Mac OS X

First, you need to obtain a free copy of FASP kernel functions from our public Hg repository. If you are downloading FASP for the first time, you can clone the repository to your local machine:

³Official website: <https://bitbucket.org/>

⁴Official website: <http://mercurial.selenic.com/>

⁵Official website: <http://easyhg.org>

⁶Official website: <http://www.sourcetreeapp.com>

⁷The hgbook, <http://hgbook.red-bean.com/>

```
"Download FASP kernel subroutines via HTTPS"
$ hg clone https://faspusers@bitbucket.org/fasp/faspsolver
```

If you have any problems when clone this repository, please send us an email to faspdev@gmail.com.

After a long pause⁸, you should have obtained “*faspsolver*” in your current directory successfully. If you have already cloned the repository before, you can just pull a new version and update your local version with it: Go to your local “*faspsolver*” directory and then

```
"Pull a new version from BitBucket"
$ hg pull

"Update you local version to the new version"
$ hg update
```

Windows OS

If you are using Windows, you may want to install TortoiseHg⁹. After installing it, the TortoiseHg menu has been merged into the right-click menu of Windows Explore. You could download FASP copy from BitBucket.org. Choose “TortoiseHg” --> “Clone” in the pop-up menu, the source address is

<https://faspusers@bitbucket.org/fasp/faspsovler>

Then press “Clone” and you will obtain “*faspsolver*” in the directory you set.

1.5 Building and installing the FASP library and examples

FASP has been tested using the compilers and built-in libraries of several Linux distributions (Cent OS, Debian, Fedora, RedHat, Ubuntu) Mac OS X 10.6 and later (Leopard, Snow Leopard, Lion, Mavericks, Yosemite, El Capitan), and Windows (XP, Win 7) with several compliers, including gcc, g++, clang, icc, VC++. FASP also easily links to applications written in Fortran and this has been tested with gfortran, g95, ifort Fortran compilers.

⁸In fact, a very long pause. This is because the initial clone with copy all the history data which is about 400MB in total. Depending on the speed of your network, it could take 15 minutes to one hour.

⁹Official website: <http://tortoisehg.bitbucket.org/>

FASP on Linux or Mac OS X

To build the FASP library for these operating systems. Open a terminal window, where you can issue commands from the command line and do the following: (1) go to the main FASP directory (we will refer to it as `$(faspsolver)` from now on); (2) modify the “*FASP.mk.example*” file to match your system and save it as “**FASP.mk**”; (3) then execute:

```
$ make config
$ make install
```

These two commands build the FASP library/header files. It installs the library in `$(faspsolver)/lib` and the header files in `$(faspsolver)/include`. It also creates a file `$(faspsolver)/Config.mk` which contains few of the configuration variables and can be loaded by external project Makefiles (see §1.6 for details on `$(faspsolver)Config.mk`).

If you do not have “FASP.mk” present in the current directory, default settings will be used for building and installation FASP.

Note: While these two approaches to build the FASP test suite and the FASP examples produce equivalent result in most cases, we note an important difference. The former approach uses a CMake installation process. The latter works without invoking Cmake and represents an example of how one may link an external project with the FASP library. We refer to §1.6 below for more details.

If everything went all right, you can go to the “**faspsolver/test**” directory and try to run a test problem:

```
$ ./test.ex
```

If you need help with the available options, type

```
$ make help
```

and you will get the following screen

```

=====
||   Fast Auxiliary Space Preconditioners (FASP)   ||
=====

Quick start:

To tune compiling options for FASP, copy "FASP.mk.example" to "FASP.mk" and put
user-defined setting there and then type "make config; make install".

More options:
=====
```

```

$ make config          # Configure the building environment
$ make config CC=gcc   # Configure with a specific C compiler
$ make config shared=yes # Configure to build shared library instead of static
$ make config debug=yes # Configure with compiler debug options ON
$ make config debug=all # Configure with FASP internal debug options ON
$ make config openmp=yes # Configure with OpenMP support
$ make config prefix=dir # Configure installation directory

$ make                # Compile the library (after "make config")
$ make install        # Install FASP library, header files, examples
$ make uninstall      # Remove the files installed by "make install"
$ make headers        # Generate function declarations automatically
$ make version        # Show version information
$ make docs           # Generate the FASP documentation with Doxygen
$ make clean          # Remove obj files but retain configuration options
$ make distclean      # Remove build directory and cleans test & tutorial
$ make help           # Show this screen

```

Many options can be changed in "FASP.mk", as well as from the command line. For example,

```

$ make config CC=gcc49 prefix=/usr/local
$ sudo make install

```

will install in the FASP library in `/usr/local/lib` and the include files in `/usr/local/include` so that they may be accessed by multiple users.

The example given above in most cases will require administrative privileges from the user, i.e. using `sudo` or other equivalent mechanism, to install in a system directory (such as `/usr/local` in our example). We do not recommend such way of installing FASP, although it will work in most cases if the user has administrative privileges. We recommend installation of FASP library/headers locally and then, if needed, copying them to a different location.

To easily uninstall FASP and clean up the working directory, FASP comes with an automatic uninstallation script; you can run

```

$ make uninstall
$ make distclean

```

Windows 7

We provide a Visual Studio 2010 (VS10) distribution and a VS10 distribution of FASP for Windows users. For example, you can just open "`faspsolver/vs10/faspsolver-vs10.sln`" if you are using VS08 as your default developing environment. Then a single-click at the "Build Solution" on the menu or "F7" key will give you all the FASP libraries and the test programs in "`faspsolver/test/`". The way for building in VS10 is similar.

Figure 1.1: Build FASP using Visual Studio 2010.

You need a C/C++ compiler and the Visual Studio to build FASP. For example, the build can be accomplished using either Microsoft Visual C++ or Intel C compiler.

If you are using other versions of Visual Studio (like VS05 or VS12), we advise NOT to convert the “VS10” files to your newer VS version automatically because the FASP source files might be **removed** by the Visual Studio. In such a case, we recommend that you create your own version to build all the libraries and test programs.

If you need to build a VS FASP yourself, you need to create 5 projects:

1. “faspbase-c” contains all the “.c” and “.inl” files in the directory “./base/src/”. You should add “./base/include” in Additional Directories. This project contains the core subroutines of fapsolver.
2. “faspbase-f” contains all the “.f” files in “./base/extra/sparsekit”.

3. “testlib” contains all the “.c” files in “./test/src/”. You should add “./test/include” in Additional Directories.
4. “test” is an executing program for test purpose in FASP. The source file is “./test/main/test.c”.
5. “regression” is another executing program, which contains several methods to test the problems. The source file is “./test/main/regression.c”.

NOTE: If you are using Visual C++, all the C files should be compiled as C++ code (by using the /TP compiling option).

After a successful build on VS, you will have two static libraries named “faspbases-c-vs08.lib” and “faspbases-f-vs08.lib”. You can use the “lib” command to wrap them together as one single file (e.g. FASP.lib) for better portability. For example:

```
C:\FASP> lib /ltcg /out:FASP.lib faspbases-c-vs08.lib faspbases-f-vs08.lib
```

Using a TCL based GUI for installation

For users who like more a GUI based installation, we provide a simple TCL Graphical User Interface (GUI) for building the FASP library. On a machine running Linux or Mac OS X with Tcl/Tk installed, you may invoke the GUI by typing

```
$ wish FASP_install.tcl
```

If all is OK, you should see on your screen the FASP window as shown in Figure 1.2. The rest of the building process is more or less straightforward: After choosing appropriate parameters, click “Config” first, followed by clicking “Install”.

External libraries

There are a few *optional* external libraries that you might want to use, including memory allocation routines, direct solvers, ILU methods, discretization packages, etc. FASP has interfaces to several of them, for example, FASP can be linked to use UMFPack, SuperLU, MUMPS, SparseKit, dlmalloc.

1.6 Linking your own project with FASP

The FASP distribution comes with two “local” Makefile(s) in the sub-directories for “test” and “tutorial”, namely, \$(faspsolver)/test/Makefile and \$(faspsolver)/tutorial/Makefile. These

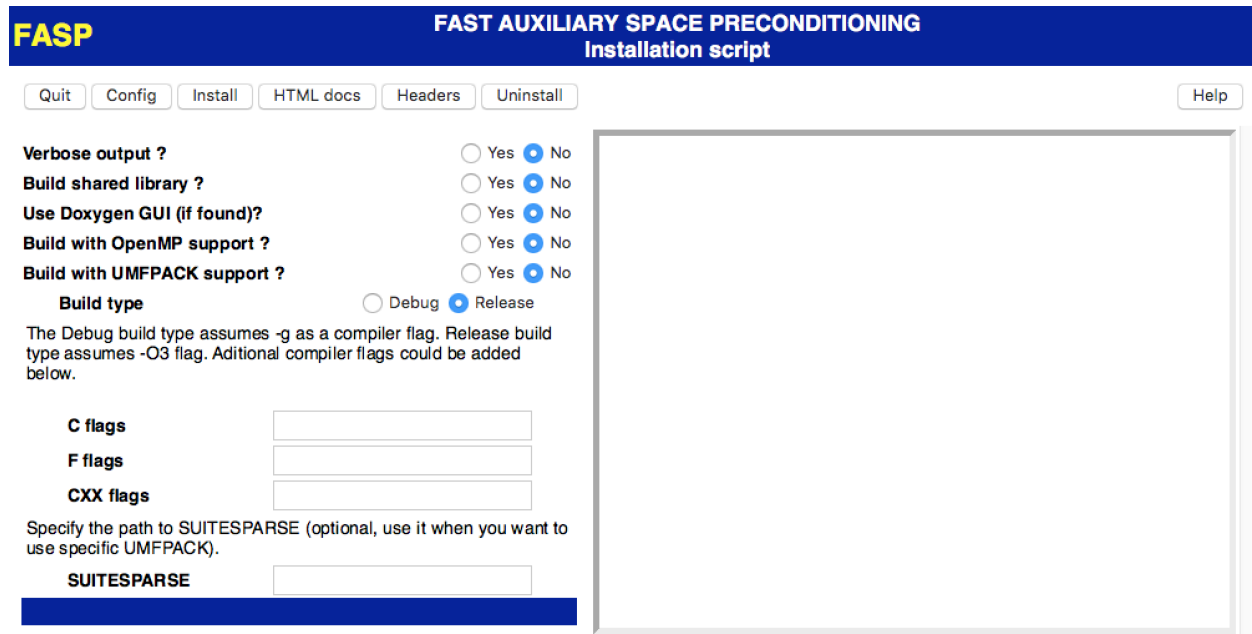

Figure 1.2: Install FASP using the TCL GUI on Mac OS X El Capitan.

two makefiles can be used to build the FASP tests and tutorial examples. They use minimal information about the library built. For convenience, at configuration time, such information is stored in `$(faspsolver)/Config.mk` file for later use. A typical contents of such file is given below:

```
##### Automatically generated #####
# Fast Auxiliary Space Preconditioners (FASP)
#
#####
# This file is rewritten when "make config" is run.
# It is (s)included by test/Makefile and tutorial/Makefile
#
#####
fasp_prefix=/path/to/faspsolver
fasp_library=libfasp.a
CC=gcc
CXX=g++
FC=gfortran
#####
```

The variables defined in this file can also be set directly in `$(faspsolver)/test/Makefile`, `$(faspsolver)/tutorial/Makefile`, or, in your own Makefile. An external project can be compiled and linked with FASP by following the rules set in `$(faspsolver)/tutorial/Makefile` (included below):

```
1 #####
```

```

2  # Fast Auxiliary Space Preconditioners (FASP)
3  #
4  #####
5  # Makefile for building the tutorial executables. If the file
6  # ../Config.mk exists it will take the values of configuration
7  # variables from there. Otherwise, they have to be user supplied below.

Chapter 2

A brief tutorial

In this chapter, we discuss several simple examples included with this FASP distribution and demonstrating how to use the FASP package for solving linear systems. We read the matrices from disk files (the files are also included in the FASP distribution). All the examples in this section can be found inside “[faspsolver/tutorial/](#)”.

After you successfully build FASP (see §1.5), just go to the “[faspsolver/tutorial/](#)” directory and the tutorial examples should be ready to run.

In this section we mainly discuss the C version of these examples; the FASP distribution also includes F90 versions of some of the examples.

In the description below, we display a typical output from runs of each of the examples. Note that the actual output depends on the solver parameters, and, on your computer it may be different than what you see here.

2.1 Example 1: An AMG solver for the Poisson equation

The first example is a standard one: We read a symmetric positive definite matrix A and right-hand side b from harddisk and then we solve $Ax = b$ using the classical AMG method [2, 13, 14]; see §3.6. In this example the matrix A included with the FASP distribution corresponds to a discretization with continuous piecewise linear finite elements of the Poisson equation

$$-\Delta u = f$$

(with the Dirichlet boundary conditions) on a triangulation of a bounded domain Ω .

```
1  /*! \file  poisson-amg.c
2  *
3  *  \brief The first test example for FASP: using AMG to solve
4  *         the discrete Poisson equation from P1 finite element.
```

```

59
60     fasp_dcsrvec_read2(filename1, filename2, &A, &b);
61
62     // Step 2. Print problem size and AMG parameters
63     if (print_level>PRINT_NONE) {
64         printf("A: m = %d, n = %d, nnz = %d\n", A.row, A.col, A.nnz);
65         printf("b: n = %d\n", b.row);
66         fasp_param_amg_print(&amgparam);
67     }
68
69     // Step 3. Solve the system with AMG as an iterative solver
70     // Set the initial guess to be zero and then solve it
71     // with AMG method as an iterative procedure
72     fasp_dvec_alloc(A.row, &x);
73     fasp_dvec_set(A.row, &x, 0.0);
74
75     fasp_solver_amg(&A, &b, &x, &amgparam);
76
77     // Step 4. Clean up memory
78     fasp_dcsr_free(&A);
79     fasp_dvec_free(&b);
80     fasp_dvec_free(&x);
81
82     return FASP_SUCCESS;
83 }
84
85 /*-----*/
86 /*--          End of File          --*/
87 /*-----*/

```

Since this is the first example, we will explain it in some detail:

- Line 1 tells the Doxygen documentation system¹ that the filename is “poisson-amg.c”. Line 3–5 tells the Doxygen what is the purpose of this file (function).
- Line 15–16 includes the main FASP header file “fasp.h” and FASP function declarations header “fasp_functs.h”. These two headers shall be included in all files that requires FASP subroutines. Please also be noted that the function declarations in “fasp_functs.h” are automatically generated from the source files by an `awk` script and we do not recommend modifying this file, since your changes may be lost.
- Line 38–39 sets solver parameters using the default parameters or from the command line options; see more discussions in §2.6. In the “tutorial/ini/amg.dat” file, we can set the location of the data files, type of solvers, maximal number of iteration numbers, convergence tolerance, and many other parameters for iterative solvers.

¹Doxygen <http://www.doxygen.org> is a useful tool for generating documentation from annotated sources. We use it in FASP development.

- Line 47 defines a sparse matrix A in the compressed sparse row (CSR) format. Line 48 defines two vectors: the right-hand side b and the numerical solution x . We refer to §3.1 for definitions of vectors and general sparse matrices.
- Line 60 reads the matrix and the right-hand side from two disk files. Line 54–58 defines the filenames of them.
- Line 60–64 prints basic information of coefficient matrix, right-hand side, and solver parameters.
- Line 72–73 allocates memory for the solution vector x and set its initial value to be all zero.
- Line 75 solves $Ax = b$ using the AMG method. Type of the AMG method and other parameters have been given in “amgparam” at Line 36; see §3.6.
- Line 78–80 frees up memory allocated for A , b , and x .

To run this example, type:

```
$ ./poisson-amg-c.ex
```

A sample output is listed as follows:

```

=====
||   FASP: AMG example — C version   ||
=====

fasp_dcsrvec_read2: reading file ../data/csrmat_FE.dat...
fasp_dcsrvec_read2: reading file ../data/rhs_FE.dat...

Setting up Classical AMG ...

Level	Num of rows	Num of nonzeros	Avg. NNZ / row
0	3969	27281	6.87
1	1985	28523	14.37
2	541	7951	14.70
3	141	1803	12.79

Grid complexity = 1.672 | Operator complexity = 2.403

Classical AMG setup costs 0.0044 seconds.

It Num	r / b	r	Conv. Factor
0	1.000000e+00	7.514358e+00	---
1	9.851978e-03	7.403129e-02	0.0099
2	3.507451e-04	2.635624e-03	0.0356
3	1.764023e-05	1.325550e-04	0.0503
4	8.820794e-07	6.628261e-06	0.0500

Number of iterations = 4 with relative residual 8.820794e-07.
 AMG solve costs 0.0019 seconds.
 AMG totally costs 0.0066 seconds.

We also provide a Fortran 90 example, which does the same thing as this C code except it gives less output, in “[tutorial/main/poisson-amg.f90](#)”. Users who would like to call FASP solver from a Fortran based application can see how to do this example.

```

1  !> \file poisson-amg.f90
2  !>
3  !> \brief The first test example for FASP: using AMG to solve
4  !>         the discrete Poisson equation from P1 finite element.
5  !>         F90 version.

66     }
67
68     // Step 3. Solve the system with ITS as an iterative solver
69     // Set the initial guess to be zero and then solve it using standard
70     // iterative methods, without applying any preconditioners
71     fasp_dvec_alloc(A.row, &x);
72     fasp_dvec_set(A.row, &x, 0.0);
73
74     fasp_solver_dcsr_itsolver(&A, &b, &x, NULL, &itparam);
75
76     // Step 4. Clean up memory
77     fasp_dcsr_free(&A);
78     fasp_dvec_free(&b);
79     fasp_dvec_free(&x);
80
81     return FASP_SUCCESS;
82 }
83
84 /*-----*/
85 /*--          End of File          --*/
86 /*-----*/

```

This example is very similar to the first example and we briefly explain the differences:

- Line 71–72 allocates memory for the solution vector x and set its initial value to be all zero.
- Line 74 solves $Ax = b$ using the general interface for Krylov subspace methods. Type the iterative method and other parameters have been specified in “itparam”; see §3.5 for details.

To run this example, we can simply type:

```
$ ./poisson-its-c.ex
```

A sample output is as follows:

```
|| FASP: ITS example — C version ||
```

```
fasp_dcsrvec_read2: reading file ../data/csrmat_FE.dat ...
fasp_dcsrvec_read2: reading file ../data/rhs_FE.dat ...
A: m = 3969, n = 3969, nnz = 27281
b: n = 3969
```

Parameters in ITS_param

2.3 Example 3: Conjugate gradient with preconditioning

This example is a bit more involved and is a modification of the previous one. In this example, we wish to demonstrate how to use the FASP library and run a preconditioned conjugate gradient (PCG) method.

```

1  /*! \file poisson-pcg.c
2  *
3  * \brief The third test example for FASP: using PCG to solve
4  *       the discrete Poisson equation from P1 finite element.
5  *       C version.
6  *

```

```

7  * \note Solving the Poisson equation (P1 FEM) with PCG: C version

49     const REAL tol          = itparam.tol;
50
51     // Step 1. Get stiffness matrix and right-hand side
52     // Read A and b -- P1 FE discretization for Poisson. The location
53     // of the data files is given in "ini/pcg.dat".
54     dCSRmat A;
55     dvector b, x;
56     char filename1[512], *datafile1;
57     char filename2[512], *datafile2;
58
59     // Read the stiffness matrix from matFE.dat

```

```

60  strncpy(filename1, inparam.workdir, 128);
61  datafile1="csrmat_FE.dat"; strcat(filename1, datafile1);
62
63  // Read the RHS from rhsFE.dat
64  strncpy(filename2, inparam.workdir, 128);
65  datafile2="rhs_FE.dat"; strcat(filename2, datafile2);
66
67  fasp_dcsrvec_read2(filename1, filename2, &A, &b);
68
69  // Step 2. Print problem size and PCG parameters
70  if (print_level>PRINT_NONE) {
71      printf("A: m = %d, n = %d, nnz = %d\n", A.row, A.col, A.nnz);
72      printf("b: n = %d\n", b.row);
73      fasp_param_solver_print(&itparam);
74  }
75
76  // Step 3. Setup preconditioner
77  // Preconditioner type is determined by pc_type
78  precondition *pc = fasp_precond_setup(pc_type, &amgparam, &iluparam, &A);
79
80  // Step 4. Solve the system with PCG as an iterative solver
81  // Set the initial guess to be zero and then solve it using PCG solver
82  // Note that we call PCG interface directly. There is another way which
83  // calls the abstract iterative method interface; see possion-its.c for
84  // more details.
85  fasp_dvec_alloc(A.row, &x);
86  fasp_dvec_set(A.row, &x, 0.0);
87
88  fasp_solver_dcsr_pcg(&A, &b, &x, pc, tol, maxit, stop_type, print_level);
89
90  // Step 5. Clean up memory
91  // First clean up the AMG data if you are using AMG as preconditioner
92  fasp_amg_data_free(((precond_data *)pc->data)->mgl_data, &amgparam);
93
94  // Clean up the pcd data
95  if (pc_type!=PREC_NULL) fasp_mem_free(pc->data);
96  fasp_mem_free(pc);
97
98  // Clean up coefficient matrix, right-hand side, and solution
99  fasp_dcsr_free(&A);
100  fasp_dvec_free(&b);
101  fasp_dvec_free(&x);
102
103  return FASP_SUCCESS;
104 }
105
106 /*-----*/
107 /*--          End of File          --*/
108 /*-----*/

```

This example is very similar to the first example, and the details are as follows.

- Line 40–41 sets default parameters. In this example, we need parameters for iterative meth-

ods, AMG preconditioner, and ILU preconditioner.

- Line 77 sets up the desired preconditioner and prepare it for the preconditioned iterative methods.
- Line 87 calls PCG to solve $Ax = b$. One can also call the general iterative method interface as in the previous example.
- Line 90 cleans up auxiliary data associated with the preconditioner in use if necessary.

To run this example, we can simply type:

```
$ ./poisson-pcg-c.ex
```

A sample output is given as follows (note that the actual output depends on the solver parameters and might be different than what you see here):

```

2.4 Example 4: An GMG solver for the Poisson equation

The geometric multigrid method (GMG) is one of the most efficient solving techniques for discrete algebraic systems arising from many types of partial differential equations [1, 16]. GMG utilizes a hierarchy of grids or discretizations and reduces the error at a number of frequencies simultaneously.

Because of its plausible linear complexity—i.e., the low computational cost of solving a linear system with N unknowns is $O(N)$ —the GMG method is one of the most popular Poisson solvers. Although the GMG’s applicability is limited as it requires explicit information on the hierarchy of the discrete system, when it can be applied, GMG is far more efficient than its algebraic version, the algebraic multigrid (AMG) method.

We now give a simple example on calling the geometric multigrid for solving the Poisson’s equation in 2D (discretized by the standard five-point finite difference stencil). Consider the Poisson equation

$$\begin{cases} -\Delta u = f & \text{in } \Omega \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

where $\Omega = (0, 1)^2 \subset \mathbb{R}^2$. The main reason why we choose this simplest possible setting is to emphasize that, even for a simple problem, the new heterogeneous architectures present challenges for numerical implementation. Another reason is to allow us to use explicit stencils and to avoid the bottleneck of sparse matrix-vector production. The standard central finite difference method is applied to discretize the Poisson’s equation. In other words, the Laplace operator is discretized by the classical second-order central difference scheme. After discretization, we end up with a system of linear equations:

$$\mathbf{A}\vec{u} = \vec{f}.$$

We use the five-point central difference scheme in 2D. Consider a uniform square mesh of $\Omega = [0, 1]^2$ with size $h = \frac{1}{n}$ and in which $x_i = ih$, $y_j = jh$ ($i, j = 0, 1, \dots, n$). Let $u_{i,j}$ be the numerical approximation of $u(x_i, y_j)$. The five-point central difference scheme for solving the Poisson’s equation in 2D can be written as follows:

$$-u_{i-1,j} - u_{i,j-1} + 4u_{i,j} - u_{i+1,j} - u_{i,j+1} = h^2 f(x_i, y_j) \quad i, j = 1, 2, \dots, n-1.$$

The sample code for this solver can be found in “[tutorial/main/poisson-gmg.c](#)” and a piece of the source code is listed as follows:

2.5 Example 5: Block ILU preconditioner

We now show a simple example for calling iterative solvers in BSR format. The test example is from a test problem given by the Society of Petroleum Engineers (SPE01 Benchmark) using a fully implicit black-oil simulator at certain time step. The test matrix is the Jacobian matrix from the Newton linearization and is stored as a BSR matrix (see §3.2 for details).

The sample code for this solver can be found in “[tutorial/main/spe01-its.c](#)” and a piece of the source code is listed as follows:

```

1  /*! \file  spe01-its.c

Iterative method costs 0.0009 seconds.
ILUk_Krylov method totally costs 0.0011 seconds.

2.6 How to change parameters for solvers/preconditioners

In the previous examples, we have seen how to use the default parameters in FASP. In this section we discuss changing such parameters by reading them from a disk file or from the command line. An example of parameter initialization file is found in the FASP tutorial directory and is named “**tutorial/ini/amg.dat**”.

```
$ ./poisson-amg-c.ex -ini ini/amg.dat
```

We take “**tutorial/ini/amg.dat**” as an example:

```

1 %-----%
2 % input parameters %
3 % lines starting with % are comments %
4 % must have spaces around the equal sign "=" %
5 %-----%
6
7 workdir = ../data/ % work directory, no more than 128 characters
8 print_level = 3 % How much information to print out
9
10 %-----%
11 % parameters for multilevel iteration %
12 %-----%
13
```

```

```

We now briefly discuss the parameters above: This example is very similar to the first example and we now briefly explain it:

- Line 7 sets the working directory, which should contain data files for the matrices (and right-

hand side vectors when necessary).

- Line 8 sets the level of output for FASP routines. It should range from 0 to 10 with 0 means no output and 10 means output everything possible.
- Line 14–25 sets the basic parameters for multilevel iterations. For example, type of AMG, type of multilevel cycles, number of maximal levels, etc.
- Line 31–38 sets the type of smoothers, number of smoothing sweeps, etc.
- Line 44–50 sets the parameters for the setup phase of the classical AMG method (§3.6).
- Line 56–60 gives the parameters for the setup phase of the aggregation-base AMG methods (§3.6).

You can do a very simple experiment—Simply change the AMG type from the classical AMG to smoothed aggregation AMG by revise Line 14 to:

AMG_type	= SA
----------	------

Then you run “poisson-amg-c.exe” one more time and will get

```

21		9.931176e-09	7.462641e-08	0.5018

Number of iterations = 21 with relative residual 9.931176e-09.

AMG solve costs 0.0060 seconds.

AMG totally costs 0.0090 seconds.

You can compare this with the results in §2.1.

Similarly, you can solve the same problem using pairwise unsmoothed aggregation AMG preconditioned conjugated gradient method by calling

```
$ ./poisson-pcg-c.ex -ini ini/amg_ua.dat
```

and it will yield the following result:

```

Number of iterations = 11 with relative residual 8.491093e-07.

```

The input parameters allowed in FASP are not limited to the ones listed in this example. A list of possible iterative methods and preconditioners can be found in “base/include/fasp_const.h”; see §4.2. For more parameters and their ranges, we refer to the FASP Reference Manual.

Using “-ini [FILE]” is just one example of allowed command line option. To find out more what command line options are acceptable, you can type in a terminal window:

```
$ ./poisson-amg-c.ex -help
```

which will give you something like

```

||  FASP: AMG example — C version  ||
||
FASP command line options:
||
--ini          [CharValue] : Ini file name
--print        [IntValue]  : Print level
--output       [IntValue]  : Output to screen or a log file
--solver       [IntValue]  : Solver type
--precond      [IntValue]  : Preconditioner type
--maxit        [IntValue]  : Max number of iterations
--tol          [RealValue] : Tolerance for iterative solvers
--amgmaxit     [IntValue]  : Max number of AMG iterations
--amgtol       [RealValue] : Tolerance for AMG methods
--amgtype      [IntValue]  : AMG type
--amgcycle     [IntValue]  : AMG cycle type
--amgcoarsening [IntValue] : AMG coarsening type
--amginterpolation [IntValue] : AMG interpolation type
--amgsmoother   [IntValue] : AMG smoother type
--amgsthreshold [RealValue] : AMG strong threshold
--amgscoupled   [RealValue] : AMG strong coupled threshold
--help         : Brief help messages

```

For example, in order to change the AMG type to the smoothed aggregation (SA) used by the preconditioner for PCG, you can also use the command line options:

```
./poisson-amg-c.ex -amgtype 2 -amgmaxit 100
```

Here we only changed two parameters from the default setting without changing anything else. So it might not give the same output as in the previous example.

Chapter 3

Data structures and basic usage

In this chapter, we discuss the basic data structures and the important building blocks which are useful for constructing auxiliary space preconditioners for systems of PDEs in Chapter 4. In particular, we will discuss vectors, sparse matrices, iterative methods, and multigrid methods.

3.1 Vectors and sparse matrices

The data structures most often used for implementing iterative methods are sparse matrices and vectors. In this section, we first discuss the data structures for vectors and matrices in FASP; and then we discuss BLAS operations for sparse matrices. The definitions can be found in “[base/include/fasp.h](#)”.

Vectors

The data structure for vectors is very simple. It only contains the length of the vector and an array which contains the entries of this vector.

```
337 /**
338  * \struct dvector
339  * \brief Vector with n entries of REAL type
340  */
341 typedef struct dvector{
342
343     /*! number of rows
344     INT row;
345
346     /*! actual vector entries
347     REAL *val;
348
349 } dvector; /**< Vector of REAL type */
```

Sparse matrices

On the other hand, sparse matrices for PDE applications are very complicated. It depends on the particular applications, discretization methods, as well as solution algorithms. In FASP, there are several types of sparse matrices, COO, CSR, CSRL, BSR, and CSR Block, etc. The presentation closely follows ideas from Pissanetzky [12].

In this section, we use the following sparse matrix as an example to explain different formats for sparse matrices:

Example 3.1.1 Consider the following 4×5 matrix with 12 non-zero entries

$$\begin{pmatrix} 1 & 1.5 & 0 & 0 & 12 \\ 0 & 1 & 6 & 7 & 1 \\ 3 & 0 & 6 & 0 & 0 \\ 1 & 0 & 2 & 0 & 5 \end{pmatrix}$$

(i) COO format

The coordinate (COO) format or IJ format is the simplest sparse matrix format.

```

199 /**
200  * \struct dCOOmat
201  * \brief Sparse matrix of REAL type in COO (IJ) format
202  *
203  * Coordinate Format (I,J,A)
204  *
205  * \note The starting index of A is 0.
206  * \note Change I to rowind, J to colind. To avoid with complex.h confliction on I.
207  */
208 typedef struct dCOOmat{
209
210     /*! row number of matrix A, m
211     INT row;
212
213     /*! column of matrix A, n
214     INT col;
215
216     /*! number of nonzero entries
217     INT nnz;
218
219     /*! integer array of row indices, the size is nnz
220     INT *rowind;
221
222     /*! integer array of column indices, the size is nnz
223     INT *colind;
224
225     /*! nonzero entries of A
226     REAL *val;
227

```

```
228 } dC00mat; /**< Sparse matrix of REAL type in COO format */
```

So it clear that the sparse matrix in Example 3.1.1 in COO format is stored as:

```
row = 4
col = 5
nnz = 12

I J  val
-----
0 0  1.0
0 1  1.5
0 4 12.0
1 1  1.0
1 2  6.0
1 3  7.0
1 4  1.0
.....
```

Although the COO format is easy to understand or use, it wastes storage space and has little advantages in sparse BLAS operations.

NOTE: In FASP, the indices always start from 0, instead of from 1. This is often the source of problems related to vectors and matrices.

(ii) CSR format

The most commonly used data structure for sparse matrices nowadays is probably the so-called *compressed sparse row* (CSR) format, according to Saad [15]. The compressed row storage format of a matrix $A \in \mathbb{R}^{n \times m}$ (n rows and m columns) consists of three arrays, as follows:

1. An integer array of row pointers of size $n+1$;
2. An integer array of column indexes of size nnz ;
3. An array of actual matrix entries.

In FASP, we define:

```
139 /**
140  * \struct dCSRmat
141  * \brief Sparse matrix of REAL type in CSR format
142  *
143  * CSR Format (IA,JA,A) in REAL
144  *
145  * \note The starting index of A is 0.
146  */
147 typedef struct dCSRmat{
```

```

148
149     //! row number of matrix A, m
150     INT row;
151
152     //! column of matrix A, n
153     INT col;
154
155     //! number of nonzero entries
156     INT nnz;
157
158     //! integer array of row pointers, the size is m+1
159     INT *IA;
160
161     //! integer array of column indexes, the size is nnz
162     INT *JA;
163
164     //! nonzero entries of A
165     REAL *val;
166
167 } dCSRmat; /**< Sparse matrix of REAL type in CSR format */

```

The matrix (only nonzero elements) is stored in the array *val* row after row, in a way that *i*-th row begins at $val(IA(i))$ and ends at $val(IA(i+1) - 1)$. In the same way, $JA(IA(i))$ to $JA(IA(i+1) - 1)$ will contain the column indexes of the non-zeros in row *i*. Thus *IA* is of size $n + 1$ (number of rows in *val* plus one), *JA* and *val* are of size equal to the number of non-zeroes. The total number of non-zeroes is equal to $IA(n + 1) - 1$.

NOTE: When the sparse matrix *A* is a boolean (i.e. all entries are either 0 or 1), the actual non-zeroes are not stored because it is understood that, if it is nonzero, it could only be 1 and there is no need to store it.

The matrix in Example 3.1.1 in CSR format is represented in the following way:

- *IA* is of size 5 and

$$IA = \parallel 0 \parallel 3 \parallel 7 \parallel 9 \parallel 12 \parallel$$

- *JA* is of size $IA(5) - 1 = 12$

$$JA = \parallel 0 \mid 1 \mid 4 \parallel 1 \mid 3 \mid 2 \mid 4 \parallel 0 \mid 2 \parallel 2 \mid 4 \mid 0 \parallel$$

- *val* is of the same size as *JA* and

$$val = \parallel 1. \mid 1.5 \mid 12. \parallel 1. \mid 7. \mid 6. \mid 1. \parallel 3. \mid 6. \parallel 2. \mid 5. \mid 1. \parallel$$

Here we use double vertical bars to separate rows and single vertical bars to separate values.

NOTE: The indices in JA and entries of val does NOT have to be ordered as seen in this example. Sometimes they are sorted in ascending order in each row. More often, the diagonal entries are stored in the first position in each row and the rest are sorted in ascending order.

Below is a “non-numeric” example.

Example 3.1.2 Consider the following sparse matrix:

$$\begin{pmatrix} a_{11} & 0 & a_{13} & 0 \\ 0 & a_{22} & a_{23} & a_{24} \\ 0 & a_{32} & 0 & a_{34} \\ a_{41} & a_{42} & a_{43} & 0 \end{pmatrix}$$

For this matrix, we have that the number of non-zeros $nnz = 10$. Furthermore, the three arrays of in the CSR format are:

$$IA = \parallel 0 \parallel 2 \parallel 5 \parallel 7 \parallel,$$

$$JA = \parallel 0 \mid 2 \parallel 1 \mid 2 \mid 3 \parallel 1 \mid 3 \parallel 0 \mid 1 \mid 2 \parallel,$$

and

$$val = \parallel a_{11} \mid a_{13} \parallel a_{22} \mid a_{23} \mid a_{24} \parallel a_{32} \mid a_{34} \parallel a_{41} \mid a_{42} \mid a_{43} \parallel.$$

NOTE: The CSR format presents challenges to sparse matrix-vector product mainly because of the high cache missing rate due to indirect memory access and irregular access pattern. In order to reduce the cache missing rate, we introduce an improved data format, CSRL.

(iii) CSRL format

CSRL matrix format [10] groups rows with same number of nonzeros together and improves cache hitting rate.

```

260  /*!
261  * \struct dCSRLmat
262  * \brief Sparse matrix of REAL type in CSRL format
263  */
264  typedef struct dCSRLmat{
265
266      /*! number of rows
267      INT row;
268
269      /*! number of cols
270      INT col;
271
272      /*! number of nonzero entries
273      INT nnz;
```

```

274
275     //! number of different values in i-th row, i=0:nrows-1
276     INT dif;
277
278     //! nz_diff[i]: the i-th different value in 'nzrow'
279     INT *nz_diff;
280
281     //! row index of the matrix (length-grouped): rows with same nnz are together
282     INT *index;
283
284     //! j in {start[i],...,start[i+1]-1} means nz_diff[i] nnz in index[j]-row
285     INT *start;
286
287     //! column indices of all the nonzeros
288     INT *ja;
289
290     //! values of all the nonzero entries
291     REAL *val;
292
293 } dCSRmat; /**< Sparse matrix of REAL type in CSRL format */

```

3.2 Block sparse matrices

For PDE applications, we often need to solve systems of partial differential equations. Many iterative methods and preconditioners could take advantages of the structure of PDE systems and improve efficiency. So we often need to use semi-structured (block) sparse data structures to store the coefficient matrix arising from PDE systems.

Depending on different applications and different solving algorithms, we can use two types of block matrices: dBSRmat (or BSR Block Compressed Sparse Row) and block_dCSRmat (CSR Block or Block of CSR matrices).

For more details as well as other specialized block matrices, readers are referred to the header file “`base/include/fasp_block.h`”.

As an example, we consider the following matrix, which have been used in §3.1 for the CSR format. We add structure to this matrix and divide it as a 2×2 block matrix:

Example 3.2.1

$$\left(\begin{array}{cc|cc} a_{11} & 0 & a_{13} & 0 \\ 0 & a_{22} & a_{23} & a_{24} \\ \hline 0 & a_{32} & 0 & a_{34} \\ a_{41} & a_{42} & a_{43} & 0 \end{array} \right)$$

(i) BSR format

This format is a standard data structure for storing block sparse matrices which has been used by the Intel MKL library.

```

24  /**
25  * \struct dBSRmat
26  * \brief Block sparse row storage matrix of REAL type
27  *
28  * \note This data structure is adapted from the Intel MKL library. Refer to:
29  * http://software.intel.com/sites/products/documentation/hpc/mkl/lin/index.htm
30  *
31  * \note Some of the following entries are capitalized to stress that they are
32  *       for blocks!
33  */
34  typedef struct dBSRmat {
35
36      //!< number of rows of sub-blocks in matrix A, M
37      INT ROW;
38
39      //!< number of cols of sub-blocks in matrix A, N
40      INT COL;
41
42      //!< number of nonzero sub-blocks in matrix A, NNZ
43      INT NNZ;
44
45      //!< dimension of each sub-block
46      INT nb; // NOTE: for the moment, allow nb*nb full block
47
48      //!< storage manner for each sub-block
49      INT storage_manner; // 0: row-major order, 1: column-major order
50
51      //!< A real array that contains the elements of the non-zero blocks of
52      //!< a sparse matrix. The elements are stored block-by-block in row major
53      //!< order. A non-zero block is the block that contains at least one non-zero
54      //!< element. All elements of non-zero blocks are stored, even if some of
55      //!< them is equal to zero. Within each nonzero block elements are stored
56      //!< in row-major order and the size is (NNZ*nb*nb).
57      REAL *val;
58
59      //!< integer array of row pointers, the size is ROW+1
60      INT *IA;
61
62      //!< Element i of the integer array columns is the number of the column in the
63      //!< block matrix that contains the i-th non-zero block. The size is NNZ.
64      INT *JA;
65
66  } dBSRmat; /**< Matrix of REAL type in BSR format */

```

For the matrix in Example 3.2.1, we have that the number of block rows $ROW = 2$, the number of block columns $COL = 2$, and the number of block nonzeros $NNZ = 4$. The block size is $nb = 2$.

We can choose different storage manners for storing the small blocks. Suppose that we set it to be 0, i.e. row-major format. Then the three arrays of in the BSR format are:

$$IA = \begin{bmatrix} 0 & 8 & 16 \end{bmatrix},$$

$$JA = \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix},$$

and

$$val = \begin{bmatrix} a_{11} & 0 & 0 & a_{22} & a_{13} & 0 & a_{23} & a_{24} \\ 0 & a_{32} & a_{41} & a_{42} & 0 & a_{34} & a_{43} & 0 \end{bmatrix}.$$

We immediately notice that this format might be not be the best choice for this particular matrix due to all the blocks are nonzero blocks, i.e., contain nonzero entries. However, for PDE applications, this does not usually happen.

(ii) BLC format

This format is simple and is derived from the dCSRmat data structure. The following definition explains itself.

```

68  /**
69   * \struct dBLCmat
70   * \brief Block REAL CSR matrix format
71   *
72   * \note The starting index of A is 0.
73   */
74  typedef struct dBLCmat {
75
76      //! row number of blocks in A, m
77      INT brow;
78
79      //! column number of blocks A, n
80      INT bcol;
81
82      //! blocks of dCSRmat, point to blocks[brow][bcol]
83      dCSRmat **blocks;
84
85  } dBLCmat; /**< Matrix of REAL type in Block CSR format */

```

3.3 I/O subroutines for sparse matrices

In FASP, we provided several functions for reading, writing, and printing different formats of sparse matrices in plain text or binary formats. These functions can be found in “[base/src/BlaIO.c](#)” and we list the available functions as follows:

```

470 void fasp_dcsrvec_read1 (const char *filename,
471                          dCSRmat    *A,
472                          dvector    *b);
473
474 void fasp_dcsrvec_read2 (const char *filemat,
475                          const char *filerhs,
476                          dCSRmat    *A,
477                          dvector    *b);
478
479 void fasp_dcsr_read (const char *filename,
480                     dCSRmat    *A);
481
482 void fasp_dcoo_read (const char *filename,
483                     dCSRmat    *A);
484
485 void fasp_dcoo_read1 (const char *filename,
486                      dCSRmat    *A);
487
488 void fasp_dcoo_shift_read (const char *filename,
489                           dCSRmat    *A);
490
491 void fasp_dmtx_read (const char *filename,
492                     dCSRmat    *A);
493
494 void fasp_dmtxsym_read (const char *filename,
495                        dCSRmat    *A);
496
497 void fasp_dstr_read (const char *filename,
498                     dSTRmat    *A);
499
500 void fasp_dbsr_read (const char *filename,
501                     dBSRmat    *A);
502
503 void fasp_dvecind_read (const char *filename,
504                        dvector    *b);
505
506 void fasp_dvec_read (const char *filename,
507                     dvector    *b);
508
509 void fasp_ivecind_read (const char *filename,
510                       ivector    *b);
511
512 void fasp_ivec_read (const char *filename,
513                     ivector    *b);
514
515 void fasp_dcsrvec_write1 (const char *filename,
516                          dCSRmat    *A,
517                          dvector    *b);
518
519 void fasp_dcsrvec_write2 (const char *filemat,
520                          const char *filerhs,
521                          dCSRmat    *A,
522                          dvector    *b);

```

```

523
524 void fasp_dcoo_write (const char *filename,
525                      dCSRmat *A);
526
527 void fasp_dstr_write (const char *filename,
528                      dSTRmat *A);
529
530 void fasp_dbsr_write (const char *filename,
531                      dBSRmat *A);
532
533 void fasp_dvec_write (const char *filename,
534                      dvector *vec);
535
536 void fasp_dvecind_write (const char *filename,
537                          dvector *vec);
538
539 void fasp_ivec_write (const char *filename,
540                      ivec *vec);
541
542 void fasp_dvec_print (const INT n,
543                      dvector *u);
544
545 void fasp_ivec_print (const INT n,
546                      ivec *u);
547
548 void fasp_dcsr_print (const dCSRmat *A);
549
550 void fasp_dcoo_print (const dCOOmat *A);
551
552 void fasp_dbsr_print (const dBSRmat *A);
553
554 void fasp_dbsr_write_coo (const char *filename,
555                          const dBSRmat *A);
556
557 void fasp_dcsr_write_coo (const char *filename,
558                          const dCSRmat *A);
559
560 void fasp_dstr_print (const dSTRmat *A);
561
562 void fasp_matrix_read (const char *filename,
563                       void *A);
564
565 void fasp_matrix_read_bin (const char *filename,
566                           void *A);
567
568 void fasp_matrix_write (const char *filename,
569                        void *A,
570                        const INT flag);
571
572 void fasp_vector_read (const char *filerhs,
573                       void *b);
574
575 void fasp_vector_write (const char *filerhs,

```

```

576         void      *b,
577         const INT   flag);
578
579 void fasp_hb_read (const char *input_file,
580                  dCSRmat  *A,
581                  dvector  *b);

```

NOTE: The above function declarations are taken from “[base/include/fasp_funcs.h](#)”. This header file is automatically generated based on the source codes. Users are discouraged from changing it by hand; their changes may be lost.

3.4 Sparse matrix-vector multiplication

The matrix-vector multiplication: $y = Ax$ can be performed in the following simple way:

```

1  /**
2  * \fn void fasp_blas_dcsr_mxv (dCSRmat *A, REAL *x, REAL *y)
3  *
4  * \brief Matrix-vector multiplication y = A*x
5  *
6  * \param A   Pointer to dCSRmat matrix A
7  * \param x   Pointer to array x
8  * \param y   Pointer to array y
9  *
10 * \author Chensong Zhang
11 * \date    07/01/2009
12 */
13 void fasp_blas_dcsr_mxv (dCSRmat *A,
14                          REAL *x,
15                          REAL *y)
16 {
17     const INT   m = A->row;
18     const INT   *ia = A->IA, *ja = A->JA;
19     const REAL *aj = A->val;
20
21     INT i, k, beg, end;
22     register REAL tmp;
23
24     for ( i=0; i<m; ++i ) {
25         tmp = 0.0;
26         beg = ia[i]; end = ia[i+1];
27         for ( k=beg; k<end; ++k ) tmp += aj[k]*x[ja[k]];
28         y[i] = tmp;
29     }
30 }

```

This is only a simple example for sparse matrix-vector multiplication (SpMV) kernel. Since we need many types of sparse matrices, there are various of versions of SpMV for different data structures. See the Reference Manual for more details.

3.5 Iterative methods

In FASP, there are a couple of standard preconditioned iterative methods [15] implemented, including preconditioned CG, BiCGstab, GMRES, Variable Restarting GMRES, Flexible GMRES, etc. In this section, we use the CSR matrix format as example to introduce how to call these iterative methods. To learn more details, we refer to the Reference Manual.

We first show the abstract interface for the iterative methods. The following code segment is taken from “[base/src/SolCSR.c](#)”:

```

37  /**
38   * \fn INT fasp_solver_dcsr_itsolver (dCSRmat *A, dvector *b, dvector *x,
39   *                                  precondition *pc, ITS_param *itparam)
40   *
41   * \brief Solve Ax=b by preconditioned Krylov methods for CSR matrices
42   *
43   * \note This is an abstract interface for iterative methods.
44   *
45   * \param A      Pointer to the coeff matrix in dCSRmat format
46   * \param b      Pointer to the right hand side in dvector format
47   * \param x      Pointer to the approx solution in dvector format
48   * \param pc      Pointer to the preconditioning action
49   * \param itparam Pointer to parameters for iterative solvers
50   *
51   * \return      Iteration number if converges; ERROR otherwise.
52   *
53   * \author Chensong Zhang
54   * \date 09/25/2009
55   */
56  INT fasp_solver_dcsr_itsolver (dCSRmat *A,
57                               dvector *b,
58                               dvector *x,
59                               precondition *pc,
60                               ITS_param *itparam)

```

The names of the input arguments explain themselves mostly and they are explained in the Reference Manual in detail.

We briefly discuss how to call this function; and, once you understand PCG, you can easily call other Krylov-type iterative methods.

```

607  // ILU setup for whole matrix
608  ILU_data LU;
609  if ( (status = fasp_ilu_dcsr_setup(A, &LU, iluparam)) < 0 ) goto FINISHED;

```

```

610
611     // check iludata
612     if ( (status = fasp_mem_iludata_check(&LU)) < 0 ) goto FINISHED;
613
614     // set preconditioner
615     precondition pc;
616     pc.data = &LU;
617     pc.fct = fasp_precond_ilu;
618
619     // call iterative solver
620     status = fasp_solver_dcsr_itsolver(A, b, x, &pc, itparam);

```

Now we explain this code segment a little bit:

- Line 608–609 performs the setup phase for ILU method. The particular type of ILU method is determined by “iluparam”; see §2.6. Line 612 performs a simple memory check for ILU.
- Line 615–617 defines the preconditioner data structure “pc”, which contains two parts: one is the actual preconditioning action “pc.fct”, the other is the auxiliary data which is needed to perform the preconditioning action “pc.data”.
- Line 620 calls iterative methods. “A” is the matrix in dCSRmat format; “b” and “x” are the right-hand side and the solution vectors, respectively. Similar to ILU setup, the type of iterative methods is determined by “itparam”.

Apparently, we should now explain the data structure “itparam”.

```

/**
 * \struct ITS_param
 * \brief Parameters for iterative solvers
 */
typedef struct {

    SHORT print_level;    /**< print level: 0--10 */
    SHORT itsolver_type;  /**< solver type: see fasp_const.h */
    SHORT precondition_type; /**< preconditioner type: see fasp_const.h */
    SHORT stop_type;      /**< stopping criteria type */
    INT restart;          /**< number of steps for restarting: for GMRES etc */
    INT maxit;            /**< max number of iterations */
    REAL tol;             /**< convergence tolerance */

} ITS_param; /**< Parameters for iterative solvers */

```

Possible “itsolver_type” includes:

```

/**
 * \brief Definition of solver types for iterative methods
 */
#define SOLVER_DEFAULT 0 /**< Use default solver in FASP */

```

```

//-----
#define SOLVER_CG          1  /**< Conjugate Gradient */
#define SOLVER_BiCGstab    2  /**< Bi-Conjugate Gradient Stabilized */
#define SOLVER_MinRes      3  /**< Minimal Residual */
#define SOLVER_GMRES       4  /**< Generalized Minimal Residual */
#define SOLVER_VGMRES      5  /**< Variable Restarting GMRES */
#define SOLVER_VFGMRES     6  /**< Variable Restarting Flexible GMRES */
#define SOLVER_GCG         7  /**< Generalized Conjugate Gradient */
#define SOLVER_GCR         8  /**< Generalized Conjugate Residual */
//-----
#define SOLVER_SCG         11 /**< Conjugate Gradient with safety net */
#define SOLVER_SBiCGstab   12 /**< BiCGstab with safety net */
#define SOLVER_SMinRes     13 /**< MinRes with safety net */
#define SOLVER_SGMRES      14 /**< GMRes with safety net */
#define SOLVER_SVGMRES     15 /**< Variable-restart GMRES with safety net */
#define SOLVER_SVFGMRES    16 /**< Variable-restart FGMRES with safety net */
#define SOLVER_SGCG        17 /**< GCG with safety net */
//-----
#define SOLVER_AMG         21 /**< AMG as an iterative solver */
#define SOLVER_FMG         22 /**< Full AMG as an solver */

```

3.6 Algebraic multigrid

The classical algebraic multigrid method [14] is an important component in many of our auxiliary space preconditioners. Because of its user-friendly and scalability, AMG becomes increasingly popular in scientific and engineering computing, especially when GMG is difficult or not possible to be applied. Various of new AMG techniques [17, 18, 4, 7, 5, 9, 6, 20, 3, 11, 8] have emerged in recent years.

The following code segment is part of “`base/src/SolAMG.c`” and it is a good example which shows how to call different AMG methods (classical AMG, smoothed aggregation, un-smoothed aggregation) and different multilevel iterative methods (V-cycle, W-cycle, AMLI-cycle, Nonlinear AMLI-cycle, etc).

```

46 void fasp_solver_amg (const dCSRmat *A,
47                     const dvector *b,
48                     dvector *x,
49                     AMG_param *param)
50 {
51     const SHORT max_levels = param->max_levels;
52     const SHORT prtlvl     = param->print_level;
53     const SHORT amg_type   = param->AMG_type;
54     const SHORT cycle_type = param->cycle_type;
55     const INT nnz = A->nnz, m = A->row, n = A->col;
56
57     // local variables
58     SHORT status;
59     AMG_data * mgl = fasp_amg_data_create(max_levels);

```

```

60     REAL          AMG_start = 0, AMG_end;
61
62     #if DEBUG.MODE > 0
63         printf("### DEBUG: [-Begin-] %s ...\n", __FUNCTION__);
64     #endif
65
66     if ( prtlvl > PRINT_NONE ) fasp_gettime(&AMG_start);
67
68     // check matrix data
69     fasp_check_dCSRmat(A);
70
71     // Step 0: initialize mgl[0] with A, b and x
72     mgl[0].A = fasp_dcsr_create(m, n, nnz);
73     fasp_dcsr_cp(A, &mgl[0].A);
74
75     mgl[0].b = fasp_dvec_create(n);
76     fasp_dvec_cp(b, &mgl[0].b);
77
78     mgl[0].x = fasp_dvec_create(n);
79     fasp_dvec_cp(x, &mgl[0].x);
80
81     // Step 1: AMG setup phase
82     switch (amg_type) {
83
84         case SA_AMG: // Smoothed Aggregation AMG setup
85             status = fasp_amg_setup_sa(mgl, param); break;
86
87         case UA_AMG: // Unsmoothed Aggregation AMG setup
88             status = fasp_amg_setup_ua(mgl, param); break;
89
90         default: // Classical AMG setup
91             status = fasp_amg_setup_rs(mgl, param); break;
92     }
93
94
95     // Step 2: AMG solve phase
96     if ( status == FASP_SUCCESS ) { // call a multilevel cycle
97
98         switch (cycle_type) {
99
100             case AMLI_CYCLE: // AMLI-cycle
101                 fasp_amg_solve_amli(mgl, param); break;
102
103             case NL_AMLI_CYCLE: // Nonlinear AMLI-cycle
104                 fasp_amg_solve_namli(mgl, param); break;
105
106             default: // V,W-cycles (determined by param)
107                 fasp_amg_solve(mgl, param); break;
108
109         }
110
111         fasp_dvec_cp(&mgl[0].x, x);
112

```

```

113     }
114
115     else { // call a backup solver
116
117         if ( prtlvl > PRINT_MIN ) {
118             printf("### WARNING: AMG setup failed!\n");
119             printf("### WARNING: Use a backup solver instead!\n");
120         }
121         fasp_solver_dcsr_spgmres (A, b, x, NULL, param->tol, param->maxit,
122                                 20, 1, prtlvl);
123
124     }
125
126     // clean-up memory
127     fasp_amg_data_free(mgl, param);
128
129     // print out CPU time if needed
130     if ( prtlvl > PRINT_NONE ) {
131         fasp_gettime(&AMG_end);
132         fasp_cputime("AMG totally", AMG_end - AMG_start);
133     }
134
135     #if DEBUG.MODE > 0
136         printf("### DEBUG: [--End--] %s ...\n", __FUNCTION__);
137     #endif
138
139     return;
140 }

```

The code above is very simple and we only wish to point out that:

- Line 51–54 reads some of the parameters from “AMG_param”, which can be set in an input file; see §2.6.
- Line 72–79 initializes the “AMG_data” with a copy of the coefficient matrix, the right-hand side, and the initial solution (it will store the final solution eventually).
- Line 82–93 calls three different AMG setup methods, determined by “amg_type”.
- Line 98–109 calls three different multilevel iterative methods, determined by “cycle_type”.

Parameters for AMG

There are a couple of controlling parameters for algebraic multigrid methods in FASP. Basically, there are four types of parameters for AMG—They control multilevel iterations, smoothing, classical AMG setup, and aggregation AMG setup. The following is a sample from “test/ini/input.dat” and a brief explanation of each parameter is given.

```

55  %-----%

```

```

56 % parameters for multilevel iteration %
57 %-----%
58
59 AMG_type = C % C classic AMG
60 % SA smoothed aggregation
61 % UA unsmoothed aggregation
62 AMG_cycle_type = V % V V-cycle | W W-cycle
63 % A AMLI-cycle | NA Nonlinear AMLI-cycleA
64 AMG_tol = 1e-6 % tolerance for AMG
65 AMG_maxit = 1 % number of AMG iterations
66 AMG_levels = 20 % max number of levels
67 AMG_coarse_dof = 500 % max number of coarse degrees of freedom
68 AMG_coarse_solver = 0 % coarsest solver: 0 iterative |
69 % 31 SuperLU | 32 UMFPack | 33 MUMPS
70 AMG_coarse_scaling = OFF % switch of scaling of the coarse grid correction
71 AMG_amli_degree = 2 % degree of the polynomial used by AMLI cycle

112 AMG_quality_bound        = 8.0      % quality of aggregation: 8.0 sysmm | 10.0 unsymm

```

NOTE: Here we can not discuss the details of these parameters as a full discussion requires more understand of the underlying algorithms which we have completely omitted. So to learn more about, we refer to the Reference Manual.

Chapter 4

More advanced features

In this chapter, we discuss a few more advanced features of FASP. We will discuss parallel versions of FASP and its build-in features for debugging purposes. These features will be helpful for people who would like to develop on the top of FASP. For users who only wish to call a few standard solvers, they can skip this chapter.

4.1 Enabling OpenMP

OpenMP¹ (Open Multiprocessing) is an API that supports multi-platform shared memory multiprocessing programming in C, C++, and Fortran, on most processor architectures and operating systems. It consists of a set of compiler directives, library routines, and environment variables that influence run-time behavior. Some preliminary OpenMP support has been included since the very beginning of FASP. We consistently improves and expands OpenMP support as multiprocessor architectures become the dominant desktop computing environment.

NOTE: By default, OpenMP is disabled in FASP. In order to turn it on, you need to modify FASP.mk slightly as follows.

To enable OpenMP support in FASP, you can simply use the following option during the configuration stage of cmake:

```
$ make config openmp=yes
```

If you use OpenMP very often and do not want type in this extra command-line option, you need to uncomment one line in “FASP.mk”. If you do not have “FASP.mk” file, just copy “FASP.mk.example” to “FASP.mk”. Then set “openmp” to “yes” on line 44 “FASP.mk”:

¹Official website: <http://openmp.org/>

```

37 #
38 # You may use multithread version after you enable OpenMP support. To
39 # setup the environment, you need
40 # >> export OMP_NUM_THREADS=4 (for bash)
41 # >> setenv OMP_NUM_THREADS 4 (for tcsh)
42 # If you want to compile with OpenMP support, uncomment the next line:
43 #
44 # openmp=yes
45 #

```

After you build FASP with “openmp=yes”, OpenMP is turned on and the number of threads is determined by the environment variable `OMP_NUM_THREADS`. For example, to use 8 threads in `sh/bash` on a Linux or Mac OS X machine, you need to set:

```
$ export OMP_NUM_THREADS=8
```

On a Windows computer, you need to use

```
C:\FASP> set OMP_NUM_THREADS=8
```

in order to use eight threads for the current sessions. In case you need to use eight threads by default, you should set it as a system environment variable.

4.2 Predefined constants

FASP has many predefined constants used in the source files. Using these macros makes the source codes more readable. These constants are defined in “`base/include/fasp_const.h`” and a printout of this file is below:

```

1  /*! \file  fasp_const.h
2  *
3  *  \brief Definition of FASP constants, including messages, solver types, etc.
4  *
5  *-----

4.3 Debugging and how to enable it

NOTE: The default FSP build is a RELEASE version (/O3 or equivalent compiler options are enabled) and such version is compiled with optimization and no warnings are displayed during the build. How to build the FASP library with debugging enabled is described below.

There is a built-in debug feature which is intended to help developers and users to locate malfunctions and bugs in FASP (and hopefully fix them). In order to turn this feature on, you need to add the **debug** option during the config stage by

```
$ make config debug=all
```

When this debug feature is turned on, there will be a lot more information printed when you run FASP. If you just want to enable the debugging and warnings during the compile stage, you can do so by using

```
$ make config debug=yes
```
